Spanning trees (ST)

Assignment Project Exam Help

For (<https://eduassistpro.github.io>)

- (1) : min-height ST
here also BFS ST (cf. [sync](#) Echo)
- (2) : shortest paths ST (cf. [sync/async](#) Bellm)
- (3) : minimum ST (cf. [sync/async](#) GHS)
here also DFS ST (cf. [sync/async](#) Cidon)
- (1,2,3,...) : arbitrary ST (cf. [async](#) Echo)

Minimum spanning tree (MST) algorithms

- If edges have different weights, then there is a **unique** MST

Assignment Project Exam Help

- Prim (1957), Jarník (1930), Dijkstra (1959): $O(M \log N)$ or $O(M + N \log N)$
- $\log N \dots$
- <https://eduassistpro.github.io>
- faster algorithms – almost linear: Chazelle randomization: integer weights; ...
- Distributed MST (**sync, async**): **GHS** - Gallager, Humblet and Spira (1983): $O(N \log N)$; improvements linear $O(N)$; or even sub-linear

¹ "Because Sollin was the only computer scientist in this list living in an English speaking country, this algorithm is frequently called Sollin's algorithm" (Wiki)

Prim and Kruskal as particular cases of Boruvka

- **Kruskal** is a restricted Boruvka, where we only use the **overall lowest-cost MWOE** (not necessarily common) - thus, at any given step, we only merge 2 trees (one single 2-way merge)

-

<https://eduassistpro.github.io>

- **Boruvka** deals with **all MWOEs** at the same "

"level" (in the distributed case) - thus, we can p

multi-way merges "simultaneously" (a

- Quotation marks indicate that many things may happen at the same "step" or "level" ...
- The distributed MST versions exploit this ability of Boruvka

All unrooted trees (edge shapes) with 4 & 5 nodes

- Looking for MWEs (minimal working examples) where Kruskal is essentially different from Boruvka: 4 or 5 nodes?

Assignment Project Exam Help

<https://eduassistpro.github.io>

Add WeChat edu_assist_pr

- Here the selected roots have minimum eccentricities
- WLG (without loss of generality), are these all that need consideration?

Five nodes – Kruskal essentially different from Boruvka?

- B step 1: collects all red (Common MWOE) and blue (one way MWOE) edges

- K collects in order: red edges (costs 1, 2), then costs 3, 4

<https://eduassistpro.github.io>

Add WeChat edu_assist_pro

Four nodes

Assignment Project Exam Help

- On 4 nodes, Kruskal is NOT essentially different from Boruvka

<https://eduassistpro.github.io>

Further discussions

Assignment Project Exam Help

Prove, for Borůvka's algorithm:

- In any multi-way merge there is always one Common MWOE

- <https://eduassistpro.github.io>

Prove that these hold for:

- Level 0 trees, i.e. initial nodes (size 1 trees)
- Level k trees, for any $k \geq 0$

∃!

Distributed MST (Sync)

- Based on Borůvka; see Lynch, §4.4

Assignment Project Exam Help

- Nodes have **unique** IDs

•

- <https://eduassistpro.github.io/>

- could be obtained by a preliminary phase

- Edges have **unique** weights or same weight e

- e.g., by **lexicographical** comparisons, where each edge $\{i, j\}$ is represented by an ordered triple (w, v, v') , $v < v'$, where w = edge weight, v, v' = ID's of i, j

Sync MST – Comparing weights with equal weights

Assignment Project Exam Help

<https://eduassistpro.github.io>

Add WeChat edu_assist_pro

$$\{1, 2\} = (10, 1, 2) < \{1, 3\} = (10, 1, 3) < \{4, 3\} = (10, 3, 4)$$

Distributed MST (Sync)

- Time complexity: $O(N \log N)$

Message complexity: $O((N + M) \log N)$

- **Levels:** $O(\log N)$; each level defines a **spanning forest**

-

- <https://eduassistpro.github.io>

level k components into new compone

- Thus, level $k \geq 0$ has component subt

- Each component has a distinguished **lead**
identifies the component

- For connected graphs, the algorithm ends with a **MST**
(unique, if edges have different weights)

Distributed MST (Sync)

- Details may vary, with slightly different performance...

Assignment Project Exam Help

- The following diagrams use a set of suggestive, but not exactly necessary, messages

<https://eduassistpro.github.io>

- *report*
- *connect* (implies a *change-root*)
- To ensure correct component identification takes a **predefined** number of steps, $O(N)$ – nodes may need to stay **idle** until this count is completed
 - depending on the actual algorithm details, this may happen in different ways

Sync MST – Memento

Assignment Project Exam Help

- Distributed Sync MST is based on Borůvka

-

- <https://eduassistpro.github.io>

- At each given **step**: Kruskal merges exactly t merges all trees simultaneously (2-way or more)

- The **steps** of sequential Borůvka correspond to more complex **levels** (phases) in distributed Sync MST

Sync MST – Memento

- The MST is **unique**, if weights are pairwise distinct (but this can always be arranged, e.g. by lexicographic comparisons)
- There is one **single** common MWOE, aka the **core**, in all tree

<https://eduassistpro.github.io>

the **core**, i.e. of the single common MWOE (that the root stays reasonably close to the leaf)

- A level k union tree has size $\geq 2^k$ **exponentially** and there are at most $\log N$ phases
- To ensure required **synchronicity**, each level requires $O(N)$ steps (this is ok, as there are only few levels)

Sync MST – Memento

- The **accept** and **reject** messages are not really needed; i.e. the **test** messages may hold enough info for this decision.
- The **report** messages are evaluated on-the fly, at each node,

<https://eduassistpro.github.io>

the best MWOE of that subtree

- The **connect** messages are routed on the tree from the leader to the node holding the overall
- The **connect** messages **reshape** the tree, by transporting the leadership, i.e. resetting parent and child pointers along their path

Async MST – GHS and variants

Specific difficulties of the **async** version - not present in the **sync** version:

Assignment Project Exam Help

- Two neighbours may be part of the same component tree, but they have not learned this yet (logical error)

• <https://eduassistpro.github.io> ^{2k;}

- More generally, component trees may be a (logical and complexity issues)
